Homework #0

In this assignment you will need to setup your development assignment and create your first "Hello World" app based on the Google tutorial.

This assignment shouldn't be submitted and is not part of your final grade.

You can find the tutorial here:

https://developer.android.com/training/basics/firstapp/index.html

Install the Android Studio IDE and Android SDK and follow the instructions in the tutorial on using them.
Only the first 2 steps of the tutorial ('Creating an Android project' & 'Running your application') are part of this assignment.
You may do the rest if you want to but they're not mandatory.

The tutorial explains how to run your application both on a physical device and on an emulator.
Even if you plan to debug on a physical device, make sure the emulator works.

If you encounter problems running the SDK emulator, there is an option to use the genymotion emulator ( http://www.genymotion.com/).

Add to your hello world app a log line to check that you can debug the app.

You had a log by writing the following command Log.d("Ex0", "hello"); (don't forget to add the required imports).

Future assignments will not be from the Google tutorials.
